

LIFE ON E1276

Coco & Xinyue

logline

A documentary discovering the lives and history of fantastical beasts on a newly discovered planet.

Synopsis

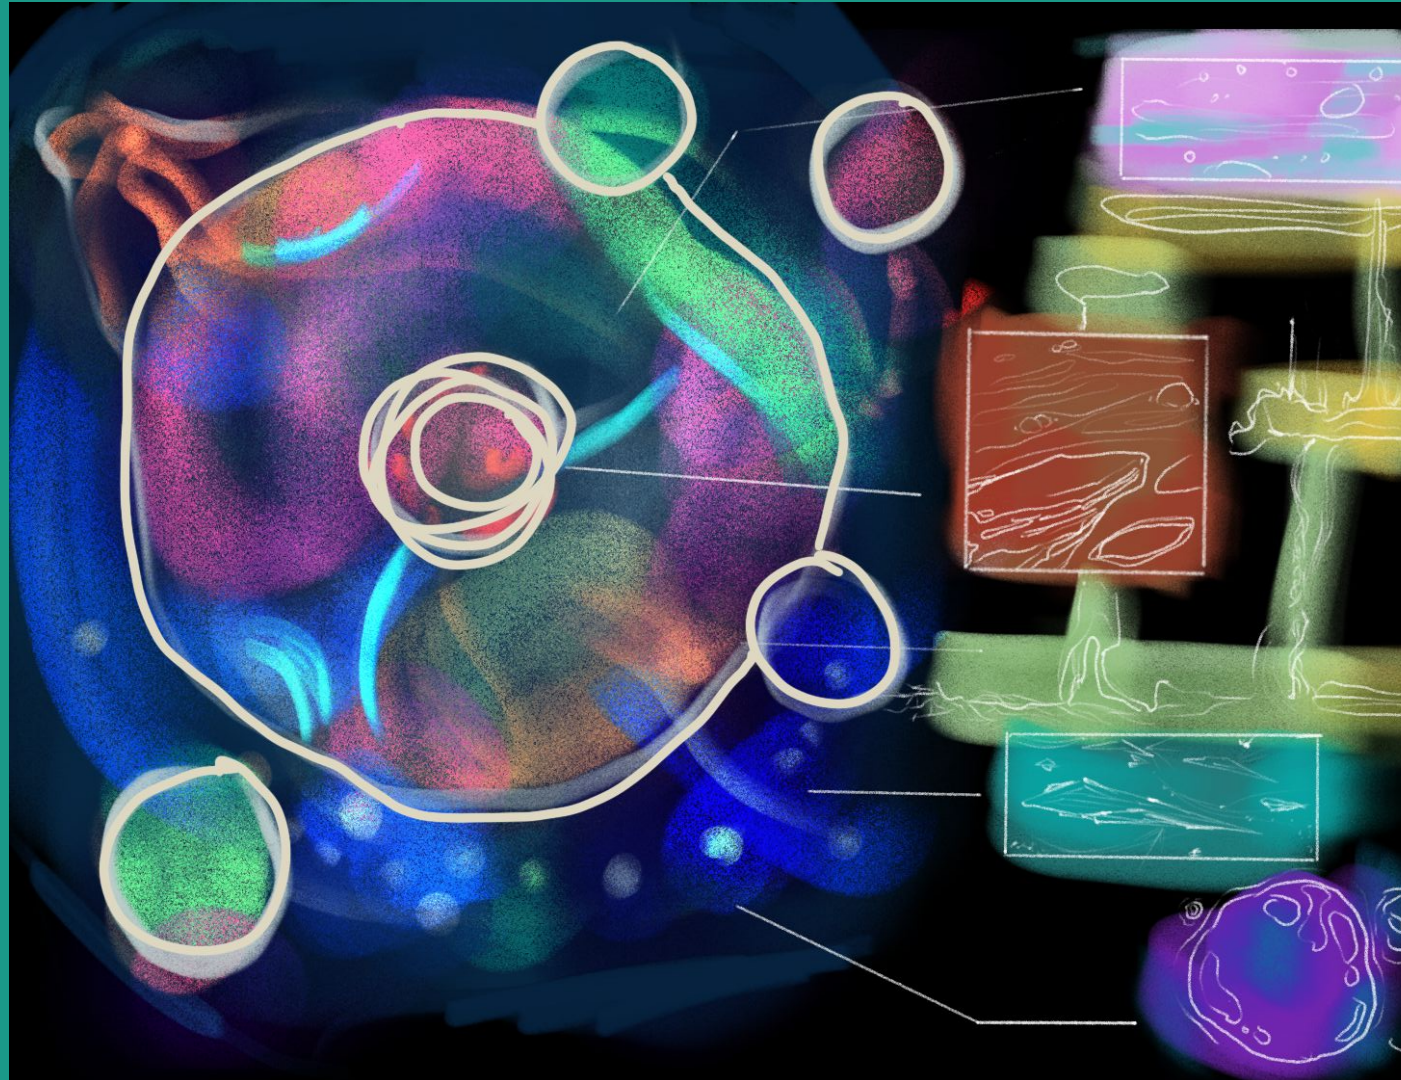

For reasons that are unknown, the balance of nature had been broken.

During this chaotic period, the creatures on Earth evolved rapidly for survival, resulting to what we are seeing now.

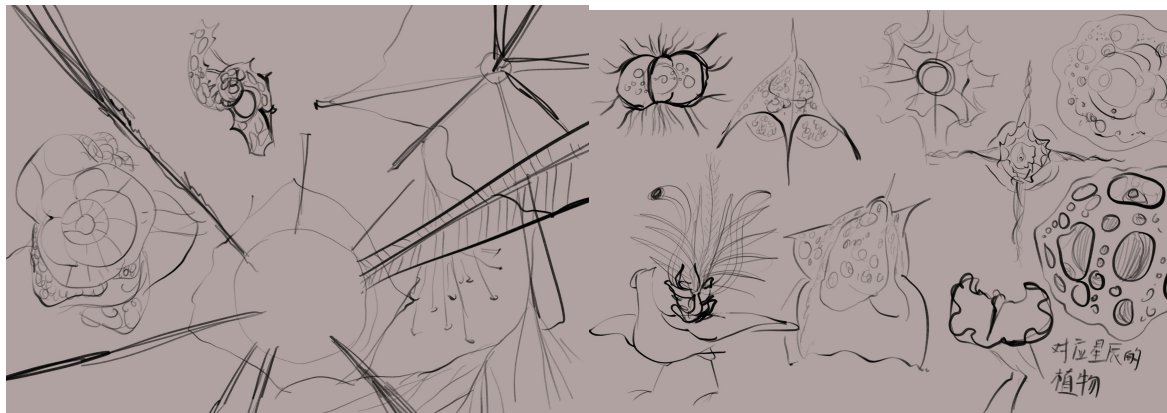

This documentary studies the complex eco system of the Earth post destruction and the strange creatures living on this soon to be deteriorating star.

Here is our first
impression of the
planet
Forests, a lost
civilisation, glaciers,
explosions
Our researchers have
entered an enchanted
land
We received a pulse of
light, transmitted a
month ago, according
to our calculations - yet
we seem to be the first
explorers to arrive

After a while we discovered the ruler of this world, presiding over its intricate ecosystem

Parasitic creatures are the primary residents of this almost deserted wonderland. These creatures seem extremely friendly yet - when we lower our guard - they attack by turning their insides out, exposing their bones which they use as weapons.

History

01

The destruction of this planet seems to have occurred in less than a single day. Through studying these relics, we may be able to deduce the reasons for its fate.

footage of earth cracking, plants growing wildly, the wind splitting the sea

02

03

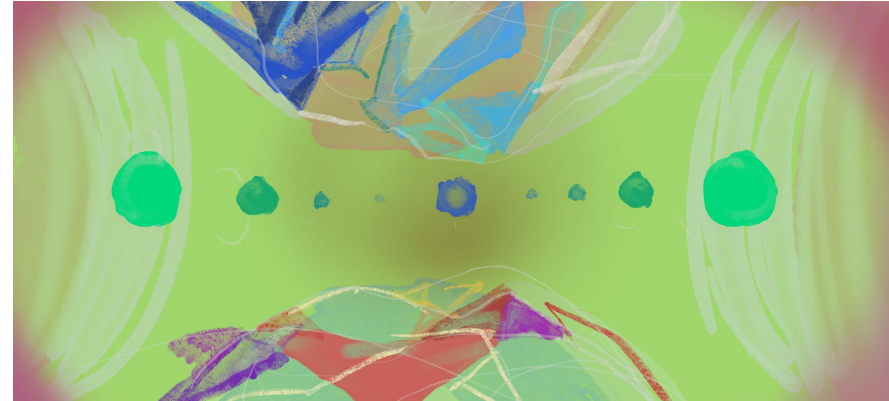

But the result of this sudden incident - whatever caused it - was a kind of miracle: the planet wasn't completely scattered into space. Instead it suffered a prolonged, agonising death.

Ocean bubbles

With its field of gravity disturbed, the planet lost its previous pattern of revolutions. It became erratic, unstable and dangerous to itself, as well as other nearby heavenly bodies.

Yet remarkably, in a short period of time, creatures still managed to evolve into life-forms capable of survival.

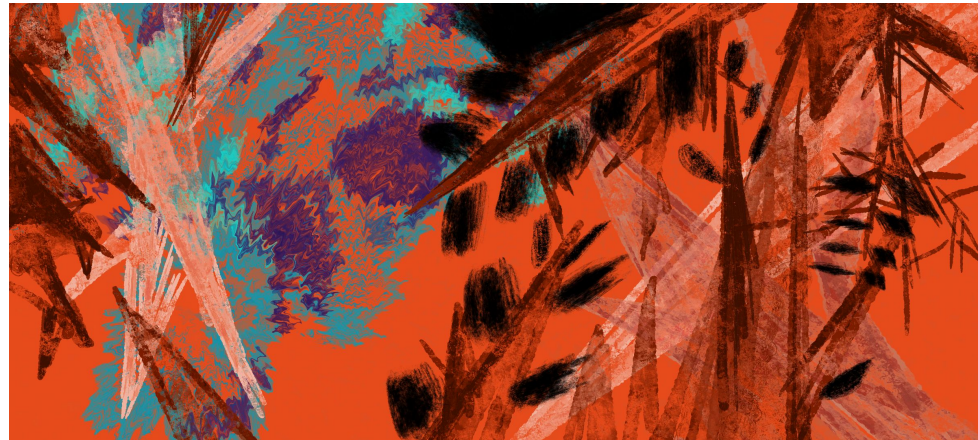

The ice was formed some 50 km above the hurricanes. and was caused by the Great Flood during the destruction of the planet. Simply put, the ground collapsed, the water floated into space, forming bubbles that floated in the air and ultimately creating organisms that could survive high pressures and extreme cold. When the gravity shifts to an extreme level, the water bubbles gather closer together and the hunting season starts. Creatures that can store water in their systems leap into other bubbles to hunt and ,if they are wounded, they split again, generating new life- forms until the gravity weakens and they all float apart again.]

Explosive Lava

Between the glazing, hot explosions of lava, up to 1000 °F, and the freezing atmosphere below -100 degrees - the extreme weather caused hurricanes to form in the atmosphere.

This animal grabs onto the lava rock and stretches its folded body upwards. In so doing, it forms layers, ventilating cooler air through its body and filtering small creatures through its stomach to sustain itself. But to survive the killer wind is hard. These creatures will themselves soon be shredded by meteor showers, and join the flying debris - made up of lava and ice - created by the explosions.

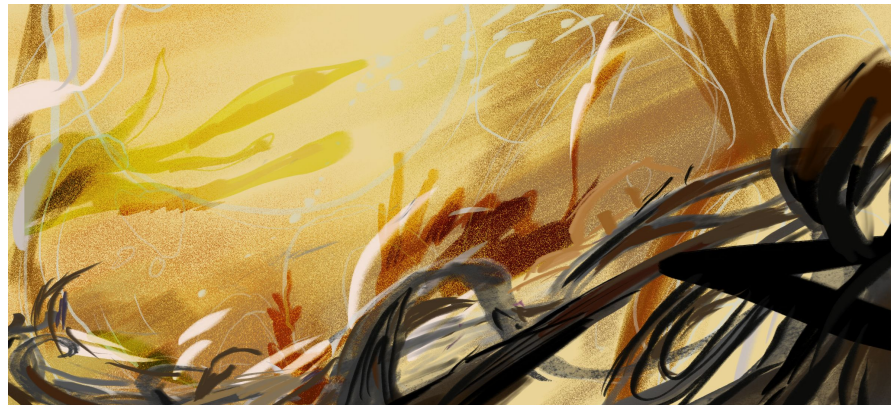

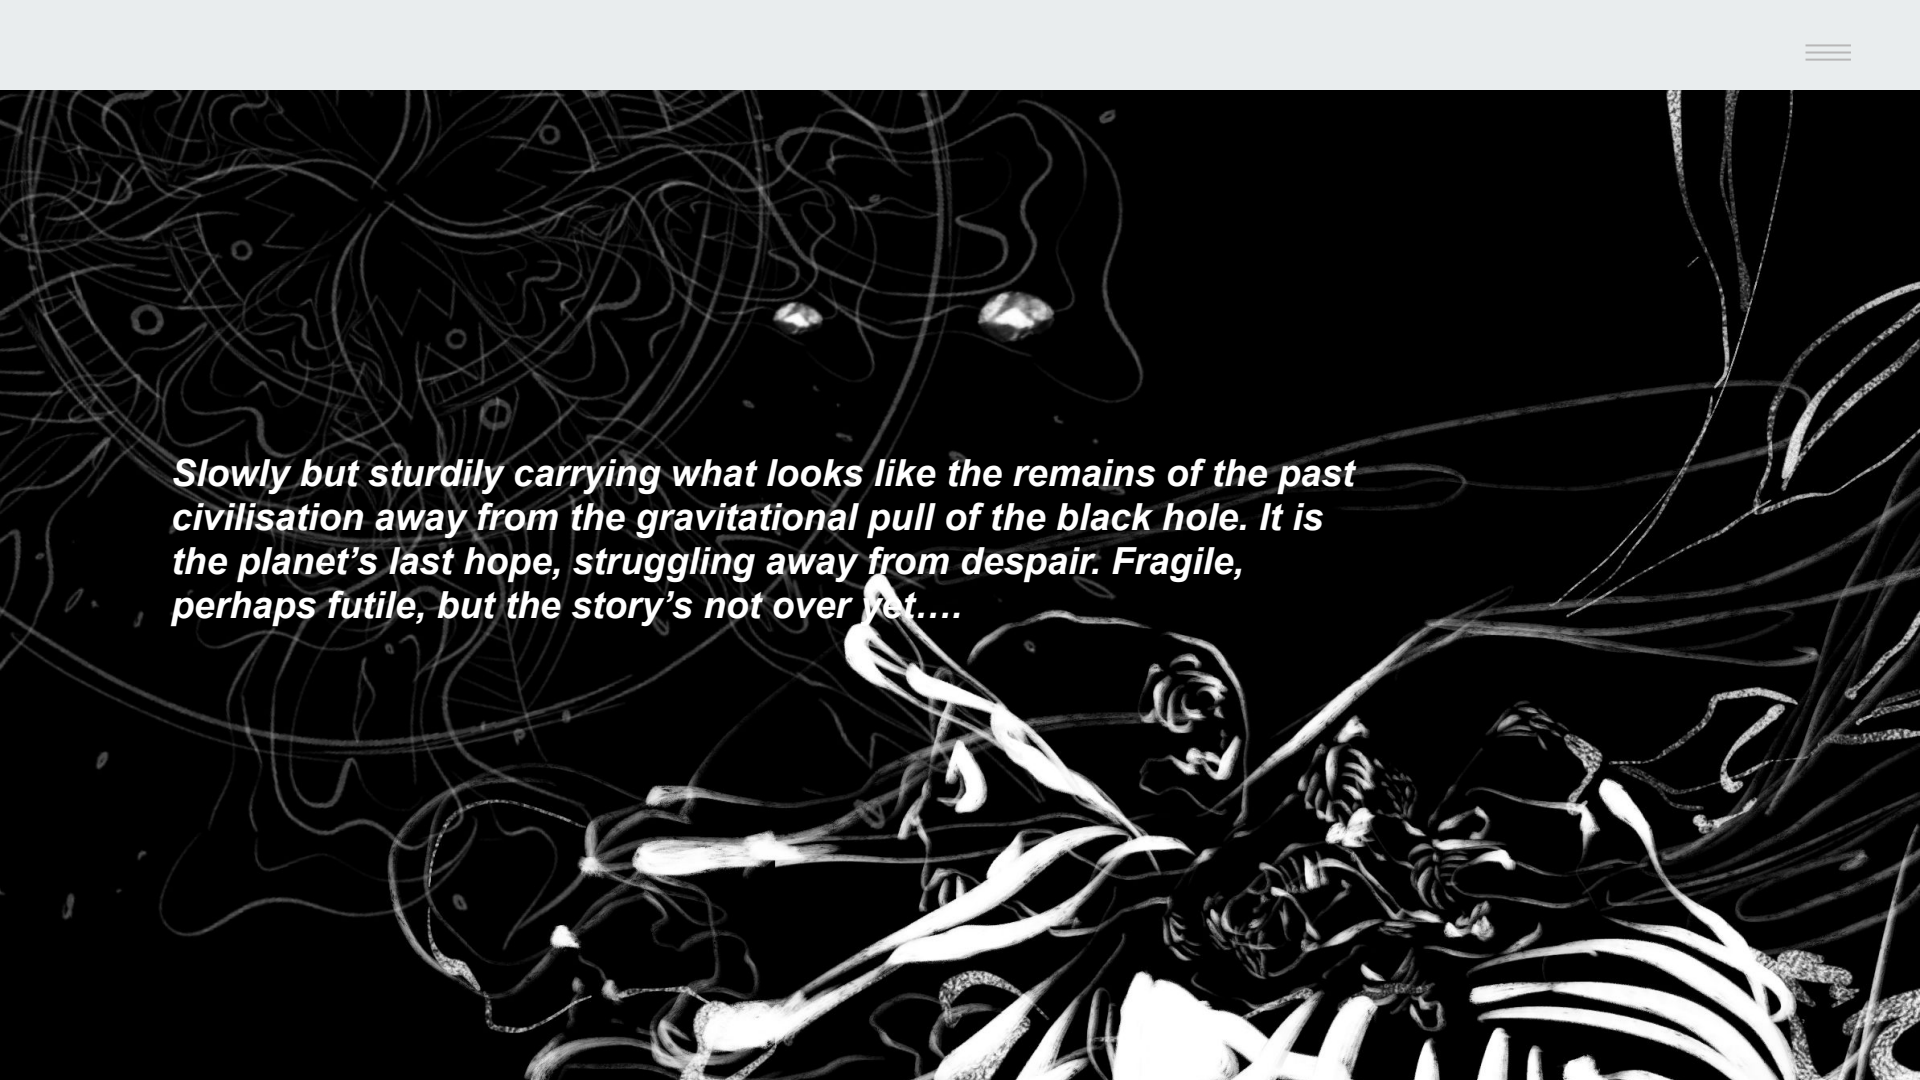

Hurricane

While observing the planet, we have noticed that this apparently remote island is indeed alive, carrying millions of lives onto the next stage of their journey [a group of moving islands floating towards a black hole].

[This living organism seems to be in a coma. [close up of the creature, it is made of human souls!!]. It has endured the feasting on its flesh, yet commits constantly to spreading its surface through an ordeal of explosions and extreme weather

Slowly but sturdily carrying what looks like the remains of the past civilisation away from the gravitational pull of the black hole. It is the planet's last hope, struggling away from despair. Fragile, perhaps futile, but the story's not over yet....

Thank you !
